

Before you begin

What You'll Need:

- Access to your site's codebase
- Your ad layout from the Ad Layout tab of the Onboarding page
- Your Freestar Point of Contact information

Critical First Step: Prevent Code Conflict

To ensure a successful launch and prevent ad interference, please replace any existing ad code for the specific placements covered by this implementation with your new Freestar tags.

- If you are migrating to the Freestar-managed GAM, ensure you've removed previous instances
- Remove any legacy Prebid.js or competing header bidding wrappers
- Ensure any ad units independent from Freestar remain enabled and untouched

Step 1: Integration (React)

1a: Add the Freestar React component to your project

Installation Instructions

Run the following command to add the Freestar React component to your project.

npm

```
npm install @freestar/pubfig-adslot-react-component --save
```

yarn

```
yarn add @freestar/pubfig-adslot-react-component
```

Peer Dependencies

Please note that react and prop-types are peer dependencies.

```
"peerDependencies": {  
  "react": ">=15.7.0",  
  "prop-types": "^15.7.2"  
}
```

1b: Create the ad unit component

Installation Instructions

You'll typically wrap FreestarAdSlot in your own small component to keep all configuration in one place.

```
import React from 'react';  
import { FreestarAdSlot } from '@freestar/pubfig-adslot-react-component';  
  
export function AdUnit(placementName) {  
  return (  
    <FreestarAdSlot
```

```
        publisher="bigbrotherjunkies-com"  
        placementName={placementName}  
      />  
    );  
  }  
}
```

Placement Code Blocks

Use the code blocks below for each ad placement. Each block is ready to copy and use in your React components.

bigbrotherjunkies_leaderboard_atf

```
<FreestarAdSlot  
  publisher="bigbrotherjunkies-com"  
  placementName="bigbrotherjunkies_leaderboard_atf"  
/>
```

bigbrotherjunkies_siderail_right_1

```
<FreestarAdSlot  
  publisher="bigbrotherjunkies-com"  
  placementName="bigbrotherjunkies_siderail_right_1"  
/>
```

bigbrotherjunkies_siderail_right_2

```
<FreestarAdSlot  
  publisher="bigbrotherjunkies-com"  
  placementName="bigbrotherjunkies_siderail_right_2"  
/>
```

bigbrotherjunkies_incontent_reusable_Homepage2

```
<FreestarAdSlot  
  publisher="bigbrotherjunkies-com"  
  placementName="bigbrotherjunkies_incontent_reusable_Homepage2"  
/>
```

bigbrotherjunkies_incontent_reusable

```
<FreestarAdSlot  
  publisher="bigbrotherjunkies-com"  
  placementName="bigbrotherjunkies_incontent_reusable"  
/>
```

bigbrotherjunkies_comments_dynamic_incontent

```
<FreestarAdSlot  
  publisher="bigbrotherjunkies-com"  
  placementName="bigbrotherjunkies_comments_dynamic_incontent"  
/>
```

bigbrotherjunkies_articles_dynamic_incontent

```
<FreestarAdSlot
  publisher="bigbrotherjunkies-com"
  placementName="bigbrotherjunkies_articles_dynamic_incontent"
/>
```

bigbrotherjunkies_middle_feed

```
<FreestarAdSlot
  publisher="bigbrotherjunkies-com"
  placementName="bigbrotherjunkies_middle_feed"
/>
```

bigbrotherjunkies_middle_post

```
<FreestarAdSlot
  publisher="bigbrotherjunkies-com"
  placementName="bigbrotherjunkies_middle_post"
/>
```

Freestar's automatic placements

See examples of how these units appear on the page in the resource center. Please note that these placements are automatically injected via Freestar head code. No additional tags or manual on-page implementation are required from your side.

FreeStarVideoAdContainer_Slider

Tips and Best Practices

- Ensure the version of React in your project matches the peer dependency range to avoid duplicate React copies in node_modules.
- Try not to place ads inside components that frequently mount or unmount. e.g. within tabs that re-render constantly

Reusable placements

By default, the component uses the placementName as the wrapper element's id. You can override this by passing a slotId:

```
<FreestarAdSlot
  publisher="bigbrotherjunkies-com"
  placementName="bigbrotherjunkies-com-homepage-leaderboard"
  slotId="homepage-leaderboard-1"
/>
```

The slotId sets the id of the div containing the ad slot, which is helpful if you: Need to reuse the same placementName multiple times on a page; want cleaner / more descriptive div ids for CSS or testing; integrate with other scripts that expect a specific id.

- Need to reuse the same placementName multiple times on a page
- Want cleaner / more descriptive div ids for CSS or testing
- Integrate with other scripts that expect a specific id

Best practices for slotId:

- Make each slotId unique per page
- Don't change the slotId for the same slot across renders unless you really want a new DOM element and ad slot

1c: Optional Step: Component API & Options

Tagging options

The FreestarAdSlot component supports a set of props, hooks, and API methods that let you control:

- Ad targeting values
- Refresh behavior
- Reacting to lifecycle events (mount, unmount, refresh)
- Page-level events (e.g. SPA navigation)

Freestar's Help Center has a good breakdown on all React tagging options. The README in the github repo has a good breakdown on all React tagging options:

<https://github.com/freestarcapital/pubfig-adslot-react-component/blob/master/README.md#props>

Add targeting

You can attach targeting directly to an individual ad slot by passing a targeting object prop:

```
export function AdUnit({ placementName }) {
  return (
    <FreestarAdSlot
      publisher="bigbrotherjunkies-com"
      placementName={placementName}
      targeting={{
        section, // e.g. "sports", "news"
      }}
    />
  );
}
```

Targeting is a set of key/value pairs used to target that specific slot. Keys and values should match the naming conventions agreed with Freestar / your GAM setup.

Page-level targeting

If you need page-level targeting (applied to all slots on the page), use the static API methods on the FreestarAdSlot component.

```
import { FreestarAdSlot } from '@freestar/pubfig-adslot-react-component';

// Example: set page-level targeting on route change in a SPA
function onRouteChange(newSection) {
  FreestarAdSlot.setPageTargeting({ section: newSection });
}
```

Other useful methods (proxies for GPT):

- FreestarAdSlot.setPageTargeting(targetingObject)
- FreestarAdSlot.clearPageTargeting()
- FreestarAdSlot.trackPageView() — Use this for SPAs or slideshows where the URL changes without a full page reload

Using Freestar's dynamically injected products

If your React project includes pages where you don't render any FreestarAdSlot components, for example, a page that only shows a Freestar Sticky Footer or other non-React product, you must still ensure the wrapper script loads.

Normally, the React component bootstraps the Freestar wrapper for you. On pages without any FreestarAdSlot include your publisher head code manually in the HTML head.

```

This ensures Freestar's core library is available to any dynamically injected products on that page.

Queuing Freestar Placements

FreestarAdSlot.queueAdCalls accepts a boolean that if set to true will restrict the Freestar Library from auctioning or rendering ad units. When set to false, it will flush any queued ad units. FreestarAdSlot.releaseQueuedAds() flushes queued ad units. Please consult your Freestar Support Team before utilizing this.

TypeScript projects

The pubfig-adslot-react-component does not include a types file. If you are using TypeScript you can create your own local d.ts file for the component.

```
// src/types/freestar-adslot.d.ts
declare module '@freestar/pubfig-adslot-react-component' {
  import * as React from 'react';
```

```
export interface FreestarAdSlotProps {
  publisher: string;
  placementName: string;
  slotId?: string;
  targeting?: Record<string, string | number | boolean>;
  channel?: string;
  classList?: string[];
  adRefresh?: number;
}

export const FreestarAdSlot: React.ComponentType<FreestarAdSlotProps>;
}
```

Client-side rendering frameworks (Next.js, Remix, etc.)

If your app does server-side rendering, only render the FreestarAdSlot on the client to avoid SSR hydration issues. For example in Next.js use dynamic import with `ssr: false`.

```
import dynamic from 'next/dynamic';

const FreestarAdSlot = dynamic(
  () => import('@freestar/pubfig-adslot-react-component').then((m) => m.FreestarAdSlot),
  { ssr: false }
);
```

Step 2: Install CMP code

Tips and Best Practices

- For more information and examples of what this looks like, visit the integration guide in the resource center.

Instructions

Freestar has partnered with Sourcepoint to provide Publishers with comprehensive consent management. Using this option, Freestar automatically injects the Sourcepoint CMP onto the page when the Freestar head code initializes. You must add a resurfacing link and some CSS to complete this implementation.

Resurfacing Link

Place the button element in the footer of your page. The link will determine the user's geolocation and display "Do Not Sell or Share My Personal Information" in CCPA regions or "Privacy Preferences" in GDPR regions.

```
<button id="pmLink">Privacy Manager</button>
```

CSS for Privacy Button

Add the CSS to your existing file or hardcode the style tag into the head. You can change the remaining CSS to match your site's design, but `visibility: hidden` is required.

```
#pmLink { visibility: hidden; text-decoration: none; cursor: pointer; background: transparent; border: none; }
#pmLink:hover { visibility: visible; color: grey; }
```

Step 3: Hashed email passthrough

If you collect emails through sign-ups or newsletters, follow these steps to implement Freestar's HEM Passthrough to boost inventory value significantly. HEM securely shares a hashed version of a user's email with vendors and Prebid User ID modules, helping you identify audiences and maintain strong ad performance even as third-party cookie coverage declines. We never see or handle the actual email—it's converted into a secure, anonymous hash in the user's browser, and only this hash is passed into the ad auction. Before implementing, please ensure compliance with any applicable regulations regarding disclosures and obtain required consent before sharing user data.

Tips and Best Practices

- Please ensure compliance with any applicable regulations regarding disclosures and obtain required consent before sharing user data with upstream vendors.
- When providing a hashed email address, please note the following:
 - Validate the email using a regular expression
 - Remove leading and trailing spaces
 - Convert all ASCII characters to lowercase
 - Hash the email using SHA1, SHA256, or MD5 hash are supported (SHA256 is required)
 - Remove the following characters from the username part of Gmail addresses:
 - Periods (ASCII code 46). For example, normalize jane.doe@gmail.com to janedoe@gmail.com.
 - Plus signs (ASCII code 43) and all subsequent characters. For example, normalize janedoe+home@gmail.com to janedoe@gmail.com.

Please choose the implementation option below that is applicable to your current setup:

OPTION A: Pass plaintext email (Freestar will hash for you)

If you are not currently hashing your users' emails, add Freestar's email code anywhere you collect a user's email (e.g., sign-up or login), then call the following function to pass a user's plaintext email address. Freestar will hash the email before passing it to upstream vendors.

```
freestar.queue.push(function(){
  freestar.identity.setIdentity({
    email:EMAIL_ADDRESS
  });
});
```

OPTION B: Pass pre-hashed emails

If you already hash your users' emails within your secure backend, call the following function and pass an object containing one or more hashes of each email address. Do not place it on the user-facing (frontend) page—place it within your secure backend process that handles the email and creates the hashes.

```
freestar.queue.push(function(){
  freestar.identity.setIdentity({
    hashes: {
      sha1: SHA1_HASH,
      sha256: SHA256_HASH,
      md5: MD5_HASH
    }
  });
});
```

Step 4: Share your staging environment or test page

Implement the Freestar head code and ad tags within your staging environment. Once implemented, navigate to the Onboarding page > Testing tab to share the URL and any necessary login credentials, and our team will QA the entire site. Note: If you do not have a staging environment, please implement the tags on one low-traffic live article page for review.

Step 5: Freestar runs QA

Our tech support team will thoroughly review the implementation and provide feedback. You'll find the support team's notes in the Testing tab of your Onboarding page. Please review and address any action items that arise.

Step 6: Freestar coordinates launch

1. You've launched Freestar on your production site

Once you've launched your site, navigate to the Onboarding page and head to the Post Launch tab to let us know you've launched.

2. Freestar conducts a Final QA

Our tech support team will thoroughly review and provide feedback. You'll find the notes in the Post-Launch tab of your Onboarding page.

3. Freestar will continue monitoring performance

After launch, we'll monitor performance and set up an initial post-launch call once we've gathered about 7 days of data. Two weeks after launch, we'll enable additional features such as Dynamic Pricing Floors and Dynamic Ad Stack.
